

CS193X: Web Programming Fundamentals

Spring 2017

Victoria Kirst
(vrk@stanford.edu)

Today's schedule

Schedule:

- HTML: Background and history
- Complex selectors
- Box model
- Debugging with Chrome Inspector
- **Case study:** Squarespace Layout (will continue into Monday)

(Forgot to mention: Paths)

`img src`, `a href`, and `link href` can all take either **relative** or **absolute** paths to the resource:

- `About`
- ``
- `<link rel="stylesheet" href="css/style.css"/>`

If you are unfamiliar with paths, check out the following:

- [Absolute vs relative paths](#)
- [Unix directories and file paths](#)
- If anything's still unclear, come to [office hours!](#)

HTML: Background and History

What HTML elements can I use?

Q: Instead of ``, can I create a `<highlight>` element?

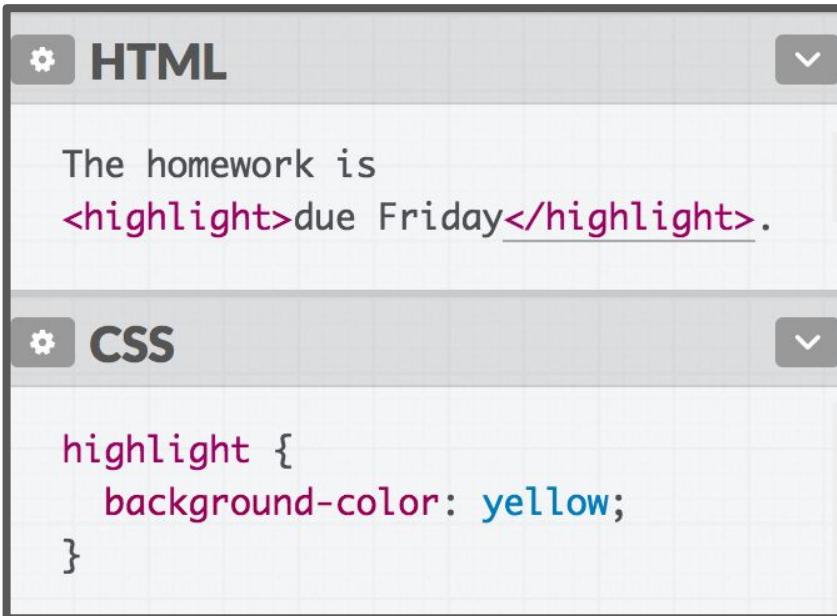

```
<p>
  The homework is
  <highlight>due Friday</highlight>.
</p>
```

```
highlight {
  background-color: yellow;
}
```

Q: Does this even work?

What HTML elements can I use?

This renders correctly:

The screenshot shows a code editor interface with two tabs: "HTML" and "CSS".

HTML Tab:

```
The homework is  
<highlight>due Friday</highlight>.
```

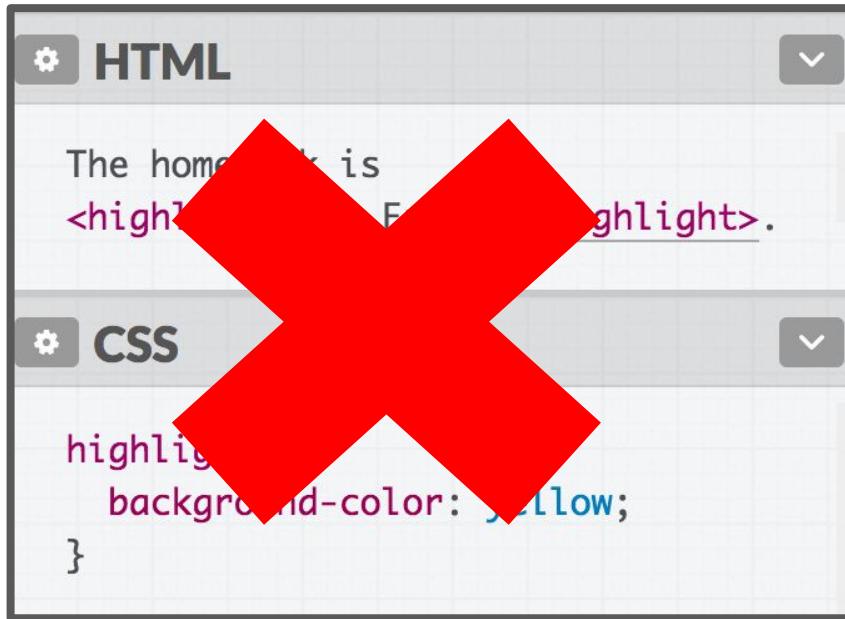

CSS Tab:

```
highlight {  
    background-color: yellow;  
}
```

The homework is due Friday.

What HTML elements can I use?

This renders correctly:

The homework is due Friday.

```
HTML
The homework is
<highlight>due Friday</highlight>.

CSS
highlight {
    background-color: yellow;
}
```

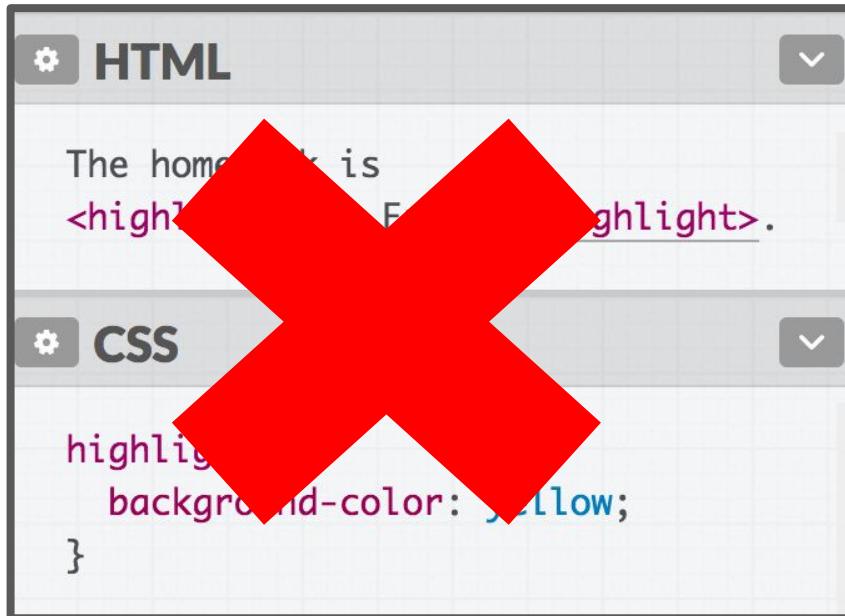

The homework is **due Friday**.

But you shouldn't do this!

It is non-standard behavior.

What HTML elements can I use?

This renders correctly:

The homework is due Friday.

```
HTML
The homework is due Friday.
<highlight>The homework is due Friday.</highlight>

CSS
highlight {
    background-color: yellow;
}
```

The homework is **due Friday**.

What?!?!

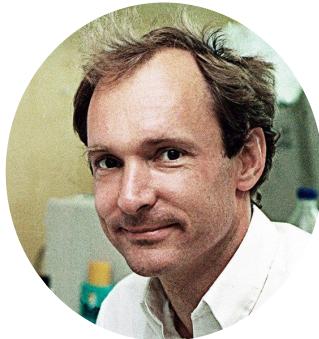

But you shouldn't do this!
It is non-standard behavior.

What?!

- What is "standard" HTML?
- Why does invalid HTML/CSS still work sometimes?
 - If my Java code is wrong, I get a compiler error... If my HTML or CSS is wrong, why don't I get an error?
- Why does it matter that I follow "standard" HTML?

A very brief history of HTML

History

Tim
Berners-Lee

- 1989: World Wide Web created
(WWW: web pages and the protocol in which they are served
HTTP/HTTPS)
- 1994: World Wide Web Consortium created
 - "W3C": Goal to maintain and develop standards about how the web should work
 - Oversees several languages:
 - HTML, CSS, DOM, XML, etc
- 1997: "HTML4" published
 - The first major stable version of HTML

Degrading gracefully

The W3C HTML spec lists several [design principles](#), and one is degrading gracefully:

"An escalator
can never
break: it can
only become
stairs"

This is why browsers do a **best-effort** to render non-standard ("invalid") HTML and CSS.

Best-effort rendering

The screenshot shows a code editor interface with two tabs: "HTML" and "CSS".

HTML:

```
The homework is  
<highlight>due Friday</highlight>
```

CSS:

```
highlight {  
    background-color: yellow;  
}
```

A large red "X" is overlaid on the entire screenshot, indicating that the code shown is incorrect or should not be used.

The homework is due Friday.

Don't do this!

Don't do this!

Don't do this!

It's also why `<highlight>` "works", even though it's Invalid HTML.

Why not enforce strict HTML?

It's super weird that:

- Browsers don't fail when given invalid HTML / CSS
- Browsers not only don't fail, but they render invalid HTML/CSS seemingly "correctly"

**Q: Why doesn't the browser reject poorly written
HTML/CSS?**

Why not enforce strict HTML?

It's super weird that:

- Browsers don't fail when given invalid HTML / CSS
- Browsers not only don't fail, but they render invalid HTML/CSS seemingly "correctly"

Q: Why doesn't the browser reject poorly written HTML/CSS?

A: There was a (failed) attempt to enforce this, but it was too late: the Internet grew too big!

The nerdy, mostly* accurate backstory for HTML today

*I would be more accurate, but it's hard to get valid sources online... so I'm going off of what I can + the lore I've heard while working on a browser.

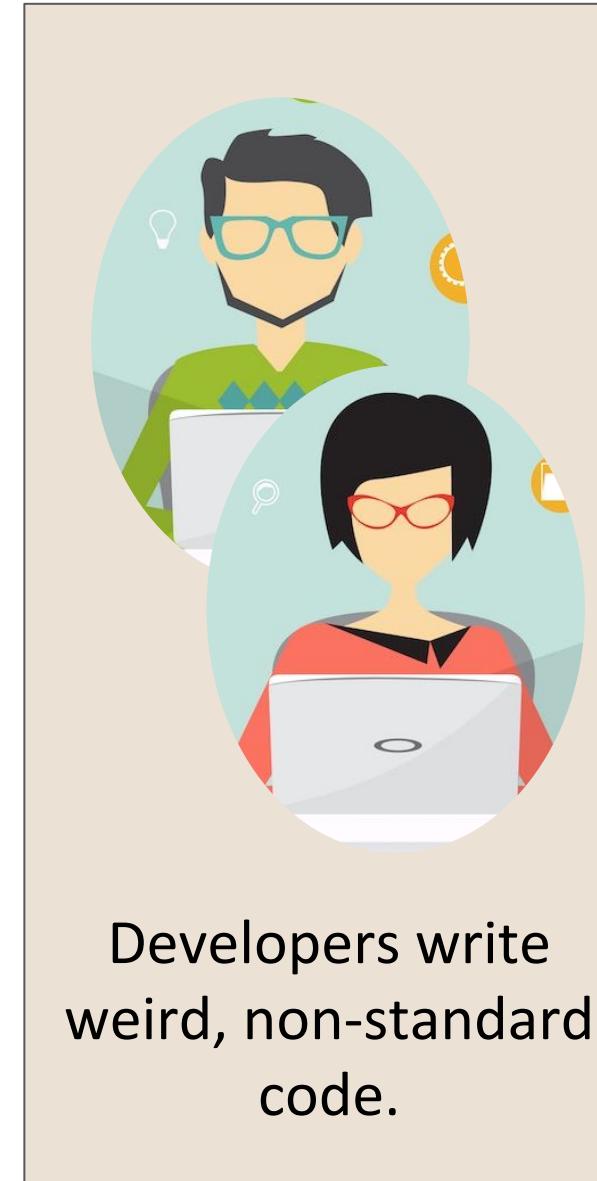

State of the world, 1997:

Standards say
one thing,

Browsers do
another thing,

Developers write
weird, non-standard
code.

State of the world, 1997:

In 1997, things are kind of a mess!

Standard
one thing,

another thing,

Developers write weird, non-standard code.

2000ish:

W3C

Oops, that "degrading
gracefully" thing was
a mistake.

Browsers, stop
rendering pages that
have invalid HTML.

(This what the proposal of XHTML 1.1)

2000ish: (not totally accurate)

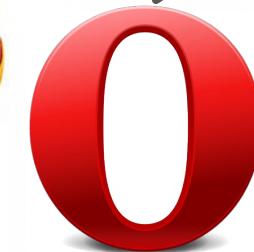

W3C

That would
break the
internet!

What?!?!

Sure
whatever

We can't
do that!

2004: WHATWG formed

**Let's burn everything and
start from scratch with
XHTML 1.1**

(break approx. 64 million websites)

WHATWG

Let's work on HTML5
(an imperfect but realistic standard)

Fast forward 2017?!

- W3C gave up XHTML 1.1 in 2007
- W3C and WHATWG are mostly friends (I think), though they are still separate entities
- Can still find some snarky quotes on [WHATWG website](#)

"HTML5" vs HTML

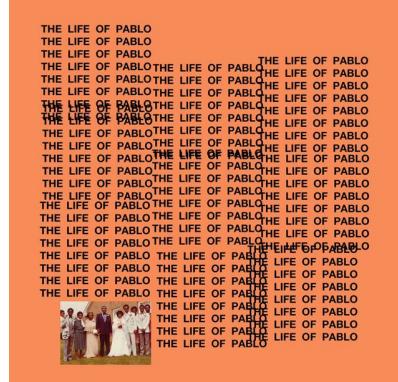

W3C maintains [HTML5](#):

- More stable version of WHATWG's HTML
- Usually copies what WHATWG does after the dust settles

WHATWG maintains [HTML: The Living Standard](#)

- No number, no versions
- Updated frequently and being updated today!
- Most browsers implement WHATWG
- This is why I don't say "HTML5"

What you need to know

Q: What HTML elements can I choose from?

- Check [MDN's list of HTML tags](#)

Q: How do I know if an HTML tag (or CSS property, or JS feature) is implemented on all browsers?

- Check [caniuse.com](#)

**Q: Why shouldn't I use non-standard
HTML/CSS/JavaScript, even if it works in every browser?**

What you need to know

Q: What HTML elements can I choose from?

- Check [MDN's list of HTML tags](#)

Q: How do I know if an HTML tag (or CSS property, or JS feature) is implemented on all browsers?

- Check [caniuse.com](#)

**Q: Why shouldn't I use non-standard
HTML/CSS/JavaScript, even if it works in every browser?**

- Because it won't be guaranteed to work in the future
- Because it won't be guaranteed to work on all "user agents" (not just browsers)

What you need to know

Q: Wouldn't it be super useful to create custom elements?

- Yes! There is a [spec for this](#) currently under development.
 - (Note that custom elements are not really meant for our example; custom elements are meant for defining custom behavior and not just style. For defining style, CSS classes/ids are still most appropriate.)

**Back to writing
code!**

CSS Selectors: Classes and Ids

Classes and ids

There are 3 basic types of CSS selectors:

Element selector (this is the one we've been using)	p	All <p> elements
❖ ID selector ❖	#abc	element with id="abc"
❖ Class selector ❖	.abc	elements with class="abc"

```
<h1 id="title">Homework</h1>
<em class="hw">HW0</em> is due Friday.<br/>
<em class="hw">HW1</em> goes out Monday.<br/>
<em>All homework due at 11:59pm.</em>
```

Other selectors

element.className

Syntax	Example	Example described
<i>element.className</i>	p.abc	<p> elements with abc class

The screenshot shows a code editor interface with two tabs: "HTML" and "CSS".

HTML Tab:

```
<h1 class="hw">Homework 0</h1>
<p class="hw">Due Fri</p>
<p class="hw">Late cutoff Sun</p>
<h1>Lectures</h1>
<p>Apr 3: Syllabus</p>
<p>Apr 5: HTML+CSS</p>
```

CSS Tab:

```
| p.hw {
|   color: green;
| }
```

The right side of the image displays the rendered HTML content with the applied CSS styles.

Homework 0

Due Fri

Late cutoff Sun

Lectures

Apr 3: Syllabus

Apr 5: HTML+CSS

Descendent selector

Syntax	Example	Example described
<i>selector selector</i>	<code>div strong</code>	<code></code> elements that are descendants of a <code><div></code>

The screenshot shows a code editor interface with two tabs: "HTML" and "CSS".

HTML Tab:

```
<div class="hw">
  <h1>Homework 0</h1>
  <p>Due Fri</p>
  <p>Late cutoff Sun</p>
</div>
```

CSS Tab:

```
.hw p {
  color: green;
}
```

To the right of the code editor, the rendered output is displayed:

Homework 0

Due Fri

Late cutoff Sun

Lectures

Apr 3: Syllabus

Apr 5: HTML+CSS

Descendent selector

Syntax	Example	Example described
<i>selector selector</i>	<code>div strong</code>	<code></code> elements that are descendants of a <code><div></code>

Note: The element does not have to be a direct child. The descendent may be nested many layers in.

The screenshot shows a code editor interface with two tabs: 'HTML' and 'CSS'. The 'HTML' tab contains the following code:

```
<div class="hw">
  <div>
    <p>
      HW0: <strong>Due Friday</strong>
    </p>
  </div>
  HW1 out <strong>Monday</strong>
</div>
```

The 'CSS' tab contains the following code:

```
.hw strong {
  color: red;
}
```

To the right of the code editor, there are two annotations in red:

- HW0: Due Friday
- HW1 out Monday

Descendent selector

Syntax	Example	Example described
<i>selector selector</i>	<code>div strong</code>	<code></code> elements that are descendants of a <code><div></code>

Discouraged:

```
<h1 class="hw">Homework 0</h1>
<p class="hw">Due Fri</p>
<p class="hw">Late cutoff Sun</p>
```

vs

```
<div class="hw">
  <h1>Homework 0</h1>
  <p>Due Fri</p>
  <p>Late cutoff Sun</p>
</div>
```

Instead of applying a class to several adjacent elements, wrap the group in a `<div>` container and style the contents via descendent selectors.

selector, selector (comma)

Syntax	Example	Example described
<i>selector, selector</i>	<code>h2, div</code>	<code><h2></code> elements and <code><div></code> s

The image shows a code editor interface with two tabs: 'HTML' and 'CSS'. The 'HTML' tab contains the following code:

```
<h1>Course Info</h1>
<h2>Lectures</h2>
<p>Mon-Wed-Fri 1:30-2:20</p>
<h2>Honor code</h2>
<p>Do the right thing</p>
```

The 'CSS' tab contains the following code:

```
h1, h2 {
    font-family: Arial;
}
```

To the right of the code editor, the rendered output is displayed:

Course Info

Lectures

Mon-Wed-Fri 1:30-2:20

Honor code

Do the right thing

Selector summary

Example	Description
p	All <p> elements
.abc	All elements with the abc class , i.e. class="abc"
#abc	Element with the abc id , i.e. id="abc"
p.abc	<p> elements with abc class
p#abc	<p> element with abc id (p is redundant)
div strong	 elements that are descendants of a <div>
h2, div	<h2> elements and <div>s

Grouping selectors

2 Common bugs:

p.abc **vs** p .abc

p .abc **vs** p, .abc

- A `<p>` element with the **abc** class **vs**
An element with the **abc** class that descends from `<p>`
- An element with the **abc** class that descends from `<p>` **vs**
All `<p>` elements *and* all elements with the **abc** class

Combining selectors

You can combine selectors:

```
#main li.important strong {  
    color: red;  
}
```

Q: What does this select?

Grouping selectors

Q: What does this select?

```
#main li.important strong {  
    color: red;  
}
```

A: Read from right to left:

- tags that are children of tags that have an "important" class that are children of the element with the "main" id.

Colliding styles

When styles collide, the most specific rule wins ([specificity](#))

```
div strong { color: red; }  
strong { color: blue; }
```

```
<div>  
  <strong>What color am I?</strong>  
</div>
```

Colliding styles

When styles collide, the most specific rule wins ([specificity](#))

```
div strong { color: red; }  
strong { color: blue; }
```

```
<div>  
  <strong>What color am I?</strong>  
</div>
```

Colliding styles

Specificity precedence rules ([details](#)):

- ids are more specific than classes
- classes are more specific than element names
- Style rules that directly target elements are more specific than style rules that are inherited

Colliding styles

- If elements have the same specificity, the later rule wins.

```
strong { color: red; }  
strong { color: blue; }
```

```
<div>  
  <strong>What color am I?</strong>  
</div>
```

Aside: The process of figuring out what rule applies to a given element is called the [cascade](#). This is where the "C" in *Cascading Style Sheets* comes from.

Inheritance

We saw earlier that CSS styles are inherited from parent to child.

Instead of selecting all elements individually:

```
a, h1, p, strong {  
    font-family: Helvetica;  
}
```

You can style the parent and the children will inherit the styles.

```
body {  
    font-family: Helvetica;  
}  
  
h1, h2 {  
    font-family: Consolas;  
}
```

You can override this style via specificity:

Inheritance

While many CSS styles are inherited from parent to child,
not all CSS properties are inherited.

```
a {  
    display: block;  
    font-family: Arial;  
}
```

`` inherits the
font-family property,
but not display:

```
<a href="/home">  
    Back to <em>Home</em>  
</a>
```

[Back to Home](#)

Inheritance

While many CSS styles are inherited from parent to child,
not all CSS properties are inherited.

- There's no rule for what properties are inherited or not; the inheritance behavior defined in the CSS spec.
- You can look it up via MDN, e.g.

<u>font-family</u> :	Inherited	yes
<u>display</u> :	Inherited	no
- Generally text-related properties are inherited and layout-related properties are not.
- (You can also change this via the inherit CSS property, which is somewhat esoteric and not often used)

<a> colors?

Hmm, MDN says color is inherited... but if I set the body color to deeppink, links don't change color:

The screenshot shows a browser's developer tools with two panels: 'CSS' and 'HTML'.

CSS Panel:

```
body {  
  color: deeppink;  
  font-family: Helvetica;  
}
```

HTML Panel:

```
<h1>Chocolate</h1>  
<p>  
  <a href="https://www.ghirardelli.com/">Ghiradelli</a>  
  is not overrated  
</p>
```

<a> inherits font-family...
Why doesn't <a> inherit color?

([Codepen](#))

The rendered HTML output shows the following content:

Chocolate

Ghiradelli is not overrated

User agent styles

This is because the browser has its own default styles:

- Browser loads its own default stylesheet on every webpage
- Not governed by spec, but there are [recommendations](#)

```
<!DOCTYPE html>
<html>
  <head>
    <title>CS 193X</title>
    <!--
      NOT TOTALLY ACCURATE: This isn't actually injected
      in the HTML, but it is loaded silently!
    -->
    <link rel="stylesheet" href="user-agent-style.css" />
  </head>
```

<a> colors?

So to style <a> links, we have to override the browser default link style by explicitly setting a color:

CSS

```
body {  
    color: deeppink;  
    font-family: Helvetica;  
}  
  
    color: deeppink;  
}
```

HTML

```
<h1>Chocolate</h1>  
<p>  
    <a href="https://www.ghirardelli.com/">Ghiradelli</a>  
    is not overrated  
</p>
```

Chocolate

Ghiradelli is not overrated

Link-related CSS

Since we're on the topic of links:

- How do we style **visited** links differently from **unvisited**?

CSS pseudo-classes

pseudo-classes: special keywords you can append to selectors, specifying a *state* or *property* of the selector

Syntax	Explanation
a	All anchor tags (links) in all states
a:visited	A visited link
a:link	An unvisited link
a:hover	The style when you hover over a link
a:active	The style when you have "activated" a link (downclick)

There are more **pseudo-classes** than this; have a look!

**Before we move on:
A few style notes**

Why not <div> everywhere?

Technically, you can define your entire web page using <div> and the class attribute.

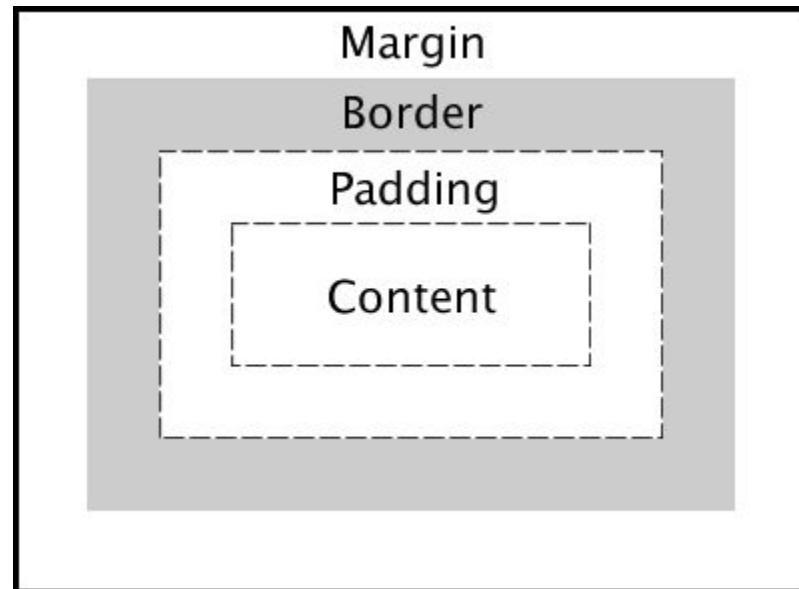

- Is this a good idea?
- Why does HTML have `ids` when you have `classes`?
- Why does HTML have <p>, <h1>, , etc. when you have <div>, , `class`, and `id`?

CSS Box Model

The CSS Box Model

Every element is composed of 4 layers:

- the element's content
- the **border** around the element's content
- **padding** space between the content and border (inside)
- a **margin** clears the area around border (outside)

border

HTML

```
<p>  
    Welcome to CS193X: Web Programming  
    In this class, you will learn modern  
    web development techniques.  
</p>
```

CSS

```
p {  
    border: 2px solid black;  
}
```

Welcome to CS193X: Web Programming Fundamentals! In this class, you will learn modern full-stack web development techniques.

We've used the shorthand:
border: width style color;

border

Can also specify each border individually:

border-top

border-bottom

border-left

border-right

And can set each property individually:

border-style: dotted; ([all styles](#))

border-width: 3px;

border-color: purple;

border

Can also specify each border individually:

border-top

border-bottom

border-left

border-right

And can set each property individually:

border-style: dotted;

([all styles](#))

border-width: 3px;

border-color: purple;

There are other units besides pixels (px) but we will address them in the next couple lectures.

Rounded border

Can specify the `border-radius` to make rounded corners:

```
border-radius: 10px;
```

You don't actually need to set a border to use `border-radius`.

```
p {  
background-color: purple;  
border-radius: 10px;  
color: white;  
}
```

Welcome to CS193X: Web Programming Fundamentals! In this class, you will learn modern full-stack web development techniques.

Borders look a little squished

When we add a border to an element, it sits flush against the text:

Q: How do we add space between the border and the content of the element?

Welcome to CS193X: Web Fundamentals! In this class, we'll learn modern full-stack web development techniques.

padding

```
p {  
    border: 2px solid black;  
    padding: 10px;  
}
```

Welcome to CS193X: Web Programming Fundamentals! In this class, you will learn modern full-stack web development techniques.

padding is the space between the border and the content.

- Can specify padding-top, padding-bottom, padding-left, padding-right
- There's also a shorthand:
`padding: 2px 4px 3px 1px; <- top|right|bottom|left`
`padding: 10px 2px; <- top+bottom|left+right`

<div>s look a little squished

When we add a border to multiple divs, they sit flush against each other:

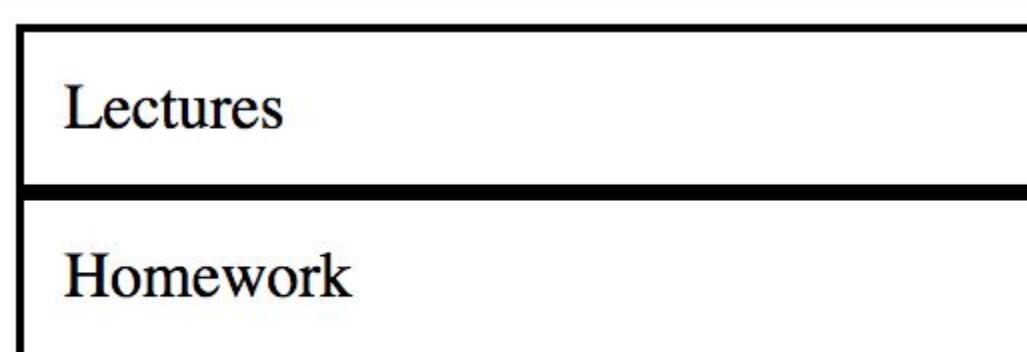

The image shows a code editor interface with two tabs: 'HTML' and 'CSS'. The 'HTML' tab contains the following code:

```
<div>
  Lectures
</div>
<div>
  Homework
</div>
```

The 'CSS' tab contains the following code:

```
div {
  border: 2px solid black;
  padding: 10px;
}
```

Q: How do we add space between multiple elements?

margin

```
div {  
  margin: 20px;  
  padding: 10px;  
  border: 2px solid black;  
}
```

Lectures

Homework

margin is the space between the border and other elements.

- Can specify margin-top, margin-bottom, margin-left, margin-right
- There's also a shorthand:
`margin: 2px 4px 3px 1px; <- top|right|bottom|left`
`margin: 10px 2px; <- top+bottom|left+right`

More box model:
Next time!
